(22)Date of filing : 23.06.1992

(72)Inventor : YAMAMOTO HIDETSUGU
MINAMINO YUTAKA**(54) LIQUID CRYSTAL DISPLAY PANEL****(57)Abstract:**

PURPOSE: To prevent fluctuations in a parasitic capacity due to deviations in the superposing of pattern and to obtain a uniform display screen in a liquid crystal display panel.

CONSTITUTION: A drain electrode 12 is formed via an insulating film on a gate electrode 7 in a position intersecting with a gate electrode 7. Two source electrodes 11a and 11b connected to a signal electrode 6 are formed, and a first and second semiconductors 15a and 15b connected to respective source electrodes 11a and 11b and juxtaposed with a spaced part provided therebetween are formed in a position where the drain electrode 12 is superposed thereon. The superposed area of the drain electrode 12 and the gate electrode 7 and the superposed area of the drain electrode 12 and the first and second semiconductor regions 15a and 15b are constant even if deviations in the superposing of respective patterns occur. As a result, as the superposed area between the gate electrode 7 and the drain electrode 12 is constant, the parasitic capacity therebetween is not varied, either. Consequently, uniformity in display of the liquid crystal display panel is improved.

**LEGAL STATUS**

[Date of request for examination] 07.09.1993

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
